

AMMP-6120

8-24 GHz x2 Frequency Multiplier

Data Sheet

Description

Avago Technologies' AMMP-6120 is an easy-to-use integrated frequency multiplier (x2) in a surface mount package designed for commercial communication systems. The MMIC takes a 4 to 12 GHz input signal and doubles it to 8 to 24 GHz. It has integrated amplification, matching, harmonic suppression, and bias networks. The input/output are matched to 50 Ω and fully DC blocked. The MMIC is fabricated using PHEMT technology.

The backside of the package is both RF and DC ground. This helps simplify the assembly process and reduces assembly related performance variations and costs. The surface mount package allows elimination of "chip & wire" assembly for lower cost. This MMIC is a cost effective alternative to hybrid (discrete-FET), passive, and diode doublers that require complex tuning and assembly processes.

Features

- 5x5mm Surface Mount Package
- Frequency Range : 8-24 GHz output (Useable to 26 GHz)
- Broad input power range: -11 to +5 dBm
- Output Power : +16 to +18 dBm
- Harmonic Suppression : 20 dBc (Fundamental)
- DC requirements : -1.4V and 5V, 112 mA @ Pin= +3dBm

Applications

- Microwave Radio systems
- Satellite VSAT and DBS systems
- 802.16 & 802.20 WiMax BWA systems
- WLL and MMDS loops

Pin	Function
1	Vd
2	Vg
3	
4	RF Out
5

 Electrostatic Discharge Damage and Control.

AMMP-6120 Absolute Maximum Ratings^[1]

Symbol	Parameters/Conditions	Unit	Minimum	Maximum
Vd	Positive Drain Voltage	V		7
Vg	Gate Supply Voltage	V	-3.0	+0.5
Idq	Drain Current	mA		120
Pin	CW Input Power	dBm		15
Tch	Operating Channel Temp.	°C		+150
Tstg	Storage Case Temp.	°C	-65	+150
Tmax	Maximum Assembly Temp.(60 sec. max.)	°C		+300

Note:

1. Operation in excess of any one of these conditions may result in permanent damage to this device.

AMMP-6120 DC Specifications/Physical Properties^[1]

Symbol	Parameters and Test Conditions	Units	Typ.	Maximum
Idq	Drain Supply Current	mA	85	110
Ig	Gate Current	μA	9	
θch-b	Thermal Resistance ^[2] (Backside temperature, Tb = 25°C)	°C/W	34	

Notes:

1. Ambient operational temperature TA=25°C unless otherwise noted.
2. Channel-to-backside Thermal Resistance (T_{channel} (Tc) = 34°C) as measured using infrared microscopy. Thermal Resistance at backside temperature (Tb) = 25°C calculated from measured data.

RF Specifications ^(3,4) (TA=25°C, Vd=5V, Vg=-1.4V, Id(Q)=85mA, Zin=Zout=50Ω)

Symbol	Parameters and Test Conditions	Units	Minimum	Typ.
Pout	Output Power ^[5]	dBm	13	16
Rlin	Input Return Loss	dB		-15
RLout	Output Return Loss	dB		-10
IP-1dB	Input Power @ 1dB Gain Comp	dBm		2
Sup	Fundamental Suppression ^[5]	dBc	18	25
Sup3	3rd Harmonic Suppression	dBc		25
Sup4	4th Harmonic Suppression	dBc		35
SSBPN	Single Side Band Phase Noise (@100kHz offset)	dBc Hz	-140 (fout=15.6GHz)	

Notes:

3. Small/Large -signal data measured in a fully de-embedded test fixture form TA = 25°C.
4. Pre-assembly into package performance verified 100% on-wafer.
5. This final package part performance is verified by a functional test correlated to actual performance at Fout=10GHz output, Pin=+3dBm.
6. All tested parameters guaranteed with measurement accuracy ±0.5dBm for Pout and ±3dBc for FS.

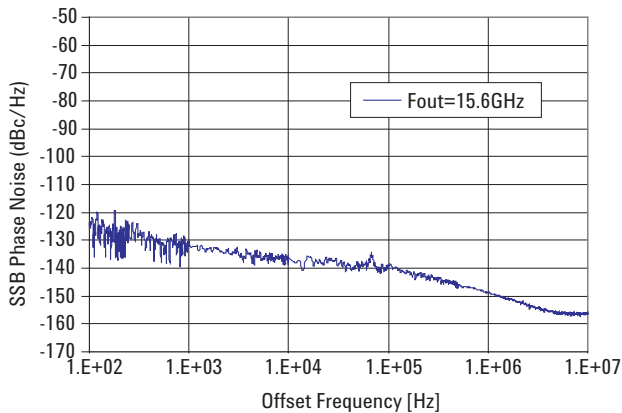

Figure.21 SSB Phase Noise of frequency doubler (Pin=+2dBm, fout=15.6GHz)

Figure 22. Top Level Schematic of Frequency doubler

Biasing and Operation

The frequency doubler MMIC consists of a balun. The outputs of this balun feed the gates of balanced FETs and the drains are connected to form the single-ended output. This results in fundamental frequency & odd harmonics cancellation. The even harmonic drain currents are in phase and thus add in phase. The input matching network (M/N) is designed to provide good match at fundamental frequencies and produces high impedance mismatch to higher harmonics.

The AMMP-6120 is biased with a single positive drain supply Vdd and a single negative gate supply using separate bypass capacitors. It is normally biased with the drain supply connected to Vd and the gate supply connected to Vg. For most applications it is recommended to use a Vg = -1.2V to -1.4V and Vd=4.5V to 5.0V.

The RF input and output ports are AC coupled thus no DC voltage is present at either port. The ground connection is made via the package base."

The AMMP-6120 performance changes with Drain Voltage (Vd) and Gate bias (Vg) as shown in the previous graphs. Improvements in output power or fundamental suppression performance are possible by optimizing the Vg from -1.2V to -1.4V and/or Vd from 4.5 to 5.0V.

A simplified schematic of the frequency multiplier is shown in figure 22. The active balun circuit and the output amplifier of the circuit are self biased. The Vg negative bias (below pinch off) is only applied to FETs 'F1' and 'F2'. FETs 'F1' and 'F2' have no significant contribution to total drain current therefore Vg cannot be used to set drain current. It should only be used to optimize the output power and fundamental & higher harmonics suppression of the doubler.

Refer to the Absolute Maximum Ratings table for allowed DC and thermal conditions.

Outline Drawing

Symbol	Min	Max
A	0.198 (5.03)	0.213 (5.4)
B	0.0685 (1.74)	0.088 (2.25)

Dimensions are in inches (mm)

Dimensional Tolerance for back view: 0.002" (0.05mm)

Notes:

- * Indicates Pin 1
- Dimensions are in inches [millimeters]
- All Grounds must be soldered to PCB RF Ground

Recommended SMT Attachment

The AMMP Packaged Devices are compatible with high volume surface mount PCB assembly processes.

The PCB material and mounting pattern, as defined in the data sheet, optimizes RF performance and is strongly recommended. An electronic drawing of the land pattern is available from www.Avago.com/view/rf or upon request from Avago Application Engineering.

Evaluation Test Circuit (Demo Board)

(Available to customer on qualified request)

Suggested PCB Material and Land Pattern

Manual Assembly

1. Follow ESD precautions while handling packages.
2. Handling should be along the edges with tweezers.
3. Recommended attachment is conductive solder paste. Please see recommended solder reflow profile. Conductive epoxy is **not** recommended. Hand soldering is **not** recommended.
4. Apply solder paste using a stencil printer or dot placement. The volume of solder paste will be dependent on PCB and component layout and should be controlled to ensure consistent mechanical and electrical performance.
5. Follow solder paste and vendor's recommendations when developing a solder reflow profile. A standard profile will have a steady ramp up from room temperature to the pre-heat temperature to avoid damage due to thermal shock.
6. Packages have been qualified to withstand a peak temperature of 260°C for 20 seconds. Verify that the profile will not expose device beyond these limits.

Solder Reflow Profile

The most commonly used solder reflow method is accomplished in a belt furnace using convection heat transfer. The suggested reflow profile for automated reflow processes is shown in Figure 23. This profile is designed to ensure reliable finished joints. However, the profile indicated in Figure 1 will vary among different solder pastes from different manufacturers and is shown here for reference only.

Recommended solder reflow profile

Figure 23. Suggested lead-free reflow profile for SnAgCu solder paste.

Stencil Design Guidelines

A properly designed solder screen or stencil is required to ensure optimum amount of solder paste is deposited onto the PCB pads. The recommended stencil layout is shown in Figure 24. The stencil has a solder paste deposition opening approximately 70% to 90% of the PCB pad. Reducing stencil opening can potentially generate more voids underneath. On the other hand, stencil openings larger than 100% will lead to excessive solder paste smear or bridging across the I/O pads. Considering the fact that solder paste thickness will directly affect the quality of the solder joint, a good choice is to use a laser cut stencil composed of 0.127 mm (5 mils) thick stainless steel which is capable of producing the required fine stencil outline.

The combined PCB and stencil layout is shown in below.

Figure 24. Stencil outline drawing (mm).

Figure 25. Combined PCB and stencil layouts (mm).

AMMP-6120 Part Number Ordering Information

Part Number	Devices Per Container	Container
