## Product Specification

## PE42420

## UltraCMOS ${ }^{\circledR}$ SPDT RF Switch 20-6000 MHz

## Product Description

The PE42420 is a HaRP™ technology-enhanced absorptive SPDT RF switch designed for use in 3G/4G wireless infrastructure and other high performance RF applications. It is ideal for transmit path switching, RF and IF signal routing, AGC loops, and filter bank switching applications.

This general purpose switch is comprised of two symmetric RF ports and has exceptional port to port isolation up to 6 GHz . An integrated CMOS decoder facilitates a two-pin low voltage CMOS control interface. In addition, no external blocking capacitors are required if 0 VDC is present on the RF ports.

The PE42420 is manufactured on pSemi's UltraCMOS ${ }^{\circledR}$ process, a patented variation of silicon-on-insulator (SOI) technology on a sapphire substrate.
pSemi's HaRP technology enhancements deliver high linearity and excellent harmonics performance. It is an innovative feature of the UltraCMOS process, offering the performance of GaAs with the economy and integration of conventional CMOS.

Figure 1. Functional Diagram

## Features

- HaRPTM technology enhanced
- No gate and phase lag
- No drift in insertion loss and phase
- High linearity
- IIP3 of 65 dBm
- High isolation
- 69 dB @ 1 GHz
- 62 dB @ 3 GHz
- 50 dB @ 6 GHz
- Supports +1.8 V control logic
- $+105^{\circ} \mathrm{C}$ operating temperature
- High ESD tolerance
- 4 kV HBM on RFC

Notes: 1. $100 \%$ duty cycle, all bands, $50 \Omega$
2. Human Body Model (MIL-STD 883 Method 3015).
3. Machine Model (JEDEC JESD22-A115).
4. At 20 MHz .
5.10 dB PAR, all bands, $50 \Omega$.

Exceeding absolute maximum ratings may cause permanent damage. Operation should be restricted to the limits in the Operating Ranges table. Operation between operating range maximum and absolute maximum for extended periods may reduce reliability.

## Electrostatic Discharge (ESD) Precautions

When handling this UltraCMOS device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the specified rating.

## Latch-Up Immunity

Unlike conventional CMOS devices, UltraCMOS devices are immune to latch-up.

## Switching Frequency

The PE42420 has a maximum 25 kHz switching frequency.

Switching frequency describes the time duration between switching events. Switching time is the time duration between the point the control signal reaches $50 \%$ of the final value and the point the output signal reaches within $10 \%$ or $90 \%$ of its target value. Switching time is provided in Table 1.

Table 5. Truth Table

| CTRL1 | CTRL2 | RFC-RF1 | RFC-RF2 |
| :---: | :---: | :---: | :---: |
| Low | Low | OFF | OFF |
| Low | High | OFF | ON |
| High | Low | ON | OFF |
| High | High | $\mathrm{N} / \mathrm{A}^{\star}$ | $\mathrm{N} / \mathrm{A}^{\star}$ |

Note: * CTRL1 = High and CTRL2 = High are not supported

## Moisture Sensitivity Level

The Moisture Sensitivity Level rating for the PE42420 in the 20 -lead $4 \times 4 \mathrm{~mm}$ LGA package is MSL3.

## Spurious Performance

The typical spurious performance of the PE42420 is -155 dBm .

For operation between 20 MHz and 100 MHz : This device uses a negative voltage generator that has a fundamental frequency of approximately 11 MHz . This will result in harmonics spurious in the 20 to 100 MHz band at approximately -110 dBm or lower. Users should consider the effect of these on their system noise figure or receiver sensitivity.

Typical Performance Data @ $+25^{\circ} \mathrm{C}$ and $\mathrm{V}_{\mathrm{DD}}=3.0 \mathrm{~V}$, unless otherwise specified

## Evaluation Kit

The SPDT switch evaluation board was designed to ease customer evaluation of pSemi 's PE42420. The RF common port is connected through a $50 \Omega$ transmission line via the top SMA connector, J2. RF1 and RF2 ports are connected through $50 \Omega$ transmission lines via SMA connectors J 1 and J3, respectively. A $50 \Omega$ through transmission line is available via SMA connectors J4 and J5, which can be used to calculate the loss of the PCB. J6 provides DC and digital inputs to the device.

The board is constructed of a four metal layer material with a total thickness of 36 mils. To achieve high isolation, the $50 \Omega$ transmission lines are designed in layer 2 using a stripline waveguide design. The board stack up for $50 \Omega$ transmission lines has 10 mil thickness of Rogers 4350 between layer 1 and layer 2, and 10 mil thickness of Rogers 4350 between layer 2 and layer 3.

For the true performance of the PE42420 to be realized, the PCB should be designed in such a way that RF transmission lines and sensitive DC I/O traces are heavily isolated from one another.
