## General Description

The TQL9042 is a high-linearity, ultra-low noise gain block amplifier with a bypass mode functionality integrated in the product. At 900 MHz, the amplifier typically provides 19 dB gain, +36 dBm OIP3, and 0.42 dB noise figure while drawing 70 mA current from a +5 V supply. The component also provides high linearity in the bypass mode with +43 dBm IIP3.

The TQL9042 is internally matched using a high performance E-pHEMT process and only requires four external components for operation from a single positive supply: an external RF choke and blocking/bypass capacitors. This low noise amplifier contains an internal active bias to maintain high performance over temperature.

The TQL9042 covers the 500–2000 MHz frequency band and is targeted for wireless infrastructure. The TQL9042 is packaged in a 3x3mm and is pin compatible with the 1.5–2.7 GHz TQL9043 and 1.5–4.0 GHz TQL9044.

**TQL9042-PCB for 1.8V TTL Compatibility**

See Evaluation Board PCB Information section for PCB material and stack-up.

**Note:**

The control voltage limit for Vctrl1 shown in the table in the bottom right corner of pg. 2 cannot be met with a simple resistive divider network at pin 10 when using a 1.8V TTL logic level. A solution is to use a diode drop as shown above. This guarantees a voltage at pin 10 which is  $\geq 0.52V$ .
